

⚠ BEFORE ANY CODE SHIPS

Dispatch didn't stop asking Meteor Mite because Mite got worse.

A missed 60-second window costs a responder exactly what an active decline does. Nobody decided that on purpose — and nobody outside Engineering can currently tell the difference.

Callout offers per week — Kip's two responders

4.2 shipped 12 Aug · reweighted proximity, cut the answer window 90s → 60s

METEOR MITE 11 → 1 offers/wk

THE GALE 13 → 21 offers/wk

Why: the ranking code scores a missed window exactly like a real "no." A shorter window means more misses — each one lowers Mite's ranking the same as a refusal would, so Mite is asked less, has fewer chances to recover, and ranks lower again.

WHAT WE'D BUILD — VISIBLE TO THE PERSON IT HAPPENS TO

🖥 Kip's console

Each coverage card shows *why* offers dropped — missed windows vs. declines — so Kip stops guessing and stops saying "hang in there."

📱 Mite's phone

A plain account, not silence: offers vs. usual, what actually happened, and a way to refresh standing directly.

OPEN BEFORE THIS IS BUILDABLE

Data

The decline/timeout split is discarded in code today — needs a real fix estimate.

Mechanism

The recovery action and its abuse limits aren't designed yet.

Sign-off

Ravi's metric, Supply's data contract, Sofia's redesign — unconfirmed.

Ask: greenlight Wen and Marcus to scope the code-level fix and its cost against this mockup, in parallel with Sofia folding it into the console redesign.
